

# Protocol-to-Attack Mapping

## Layer 2 Attacks

ARP spoofing leading to man-in-the-middle interception.

VLAN misconfiguration enabling lateral movement.

## Layer 3 and Routing Abuse

Traffic redirection through rogue gateways.

Asymmetric routing bypassing firewalls.

## Transport Layer Attacks

TCP SYN floods exhausting state tables.

UDP amplification via DNS and NTP.

## DNS Abuse

Phishing through domain impersonation.

Command-and-control over DNS queries.

## HTTP(S) Attacks

Session hijacking and token reuse.

API abuse bypassing UI controls.

## ICMP Misuse

Network mapping through ICMP sweeps.

Covert channels using ICMP payloads.
